iOS: Instagram doesn't let you save any of the images you see on the app. Likes is a neat and free solution to download any photo and video to your iPhone or iPad's Photos gallery.All you have to do is first Like a post on Instagram, which then shows up in the Likes app. From these favorites, tap any that you want to save and the app will download them to your gallery. If you want to un-Like them after downloading, long-press the thumbnail to be taken to the post in your Instagram app.Likes is only available for iOS at the moment. Android users can try EasyDownloader to grab images.Android: People share some fantastic images on Instagram, but it's a pity that you can't save them...Read moreLikes (Free) | iTunes App Store via WonderHowTo Disney+ downloads (Image credit: Ara Wagoner / Android Central) Disney+ is here and there are thousands upon thousands of hours of Disney magic to watch, but no one wants to see the data overcharges you could rack up streaming it while you're away from Wi-Fi. Thankfully, you can download videos quite easily on Disney+, from movies to individual episodes to entire TV shows, but since Disney+ defaults to the lowest download quality, I highly recommend changing it to Medium or High before you start downloading videos.Open the Disney+ app.Tap your Profile picture in the bottom right corner of the screen.Tap App Settings.Source: Ara Wagoner / Android CentralIf you don't want to wait until you're back on Wi-Fi to download your videos, you can tap Download Over Wi-Fi Only to toggle it off.Tap Download Quality.Tap the quality you prefer to use for downloads. Under each quality it tells you how many hours of content you could download at each rate before you completely fill your device's storage.Source: Ara Wagoner / Android CentralNow that you've got your quality squared away, let's get some of our favorites downloaded for when we get trapped in a dead zone.How to download videos in Disney+Open the Disney+ app.Tap a movie you want to download.Tap the download icon next to the Play and Add to Watchlist icons.Tap the back arrow in the top left corner of the screen.Source: Ara Wagoner / Android CentralTap a TV show you want to download.To download a whole season, tap the download icon to the right of the Season number.To download an individual episode, tap the download icon to the right of the episode's title, next to the Info icon.Source: Ara Wagoner / Android CentralRepeat as desired with all of your favorite shows and movies. You currently can't download extras like behind-the-scenes and audio commentary versions, but every episode and movie is available for download.How to manage downloadsWhen you want to browse your downloaded videos and clear some of them out, you can watch and manage them all from one place: the Downloads tab.Open the Disney+ app.Tap the Downloads tab (third icon from the left in the bottom row of icons).Tap a show you are downloading episodes from.To batch delete episodes, tap Edit.Source: Ara Wagoner / Android CentralTo select episodes to batch delete, tap the checkbox to the right of the episode.To select all episodes, tap the select all button in the top right corner (square icon surrounded by a dotted square).Tap the trash can icon to delete your selected episodes.Tap the phone icon (or progress icon if the episode is still downloading) icon to the right of an episode or movie.Tap Remove Download to delete the video from your device.If the video is currently downloading, tap Pause Download to hold off on downloading that particular video at the moment. If you're downloading a lot of videos, you'll have to hit pause on each and every video if you want to pause them all.Source: Ara Wagoner / Android CentralThe option to batch delete can be very useful for clearing out episodes of a show you've already watched to make room for new content. (Image credit: Tom's Guide) An image of an idyllic lake is wreaking havoc on Android phones, causing some to get caught in crash cycles and become 'soft-bricked.' This is effectively forcing users to reset their smartphones. The issue was flagged by leaker Ice Universe (opens in new tab), who noted that a simple image could cause some Android phones to continually turn the display on and off if the image is set as a wallpaper. Once in this loop, there's no way to get out of it, even if the phone is rebooted. So whatever you do, don't download and use the image on your phone. Once an Android phone is caught in the crashing loop, the only way to get out of this soft-bricked status is to reset the handset, which could cause a lot of data loss for some people who don't back their phones up to cloud services. Not every phone is affected. OnePlus and Huawei handsets are seemingly immune, but Samsung Galaxy phones seem particularly prone to the crash-causing image. WARNING ! ! ! Never set this picture as wallpaper, especially for Samsung mobile phone users!It will cause your phone to crash!Don't try it!If someone sends you this picture, please ignore it. pic.twitter.com/rVbozjdhlkMay 31, 2020See moreIt's not clear exactly what is causing this image to crash Android phones. But Ice Universe reckons it's something to do with how the color space on the image is configured and how that color profile reacts with the Skia graphics engine Android uses. Effectively, metadata behind the image could be causing problems with Android. Ice Universe tweeted that when the image was uploaded to Weibo, the service altered the colors slightly, which then seemed to prevent the image from crashing a phone when used as a wallpaper. 9to5Google (opens in new tab) did some more digging and noted that the problem is down to the color space Android wants to display. When I tried to upload the original image (left) to Weibo, I found that its color to change (right). At this time, the image became harmless, but when uploaded to twitter, the original image still does not change color, still harmful. So I suspect it may be related to color gamut pic.twitter.com/0A1PUlqpvMay 31, 2020See moreAndroid phones tend to like the sRGB color space, but the image uses the RGB color space which Android 10 doesn't play nice with. In Android 11 (opens in new tab), the color space is converted to sRGB so such crashes aren't an issue, meaning if you have a Pixel 4 XL (opens in new tab) you should be pretty safe from the problem. There's no word on where the image came from, with people avoiding posting links to it so as to curtail the spread of the damaging image. But suffice to say, if you see the image or you get sent it by someone, we very much suggest you avoid it. If you have already fallen foul to the image issue, then you'll need to factory reset your phone to get rid of it. Today's best Google Pixel 4 XL deals (opens in new tab) (opens in new tab) (opens in new tab)View (opens in new tab) (opens in new tab) (opens in new tab) (opens in new tab)\$999 (opens in new tab)View (opens in new tab) (opens in new tab) (opens in new tab)View (opens in new tab) (opens in new tab)View (opens in new tab)By Greyson Ferguson There are thousands of different videos available for cell phones. Although it can be difficult to find exactly what you want online, you may see a friend or family member with a video you would like try out. Instead of having the other individual try and remember what site the video downloaded from, you can simply download the video from the cell phone onto a computer and upload it to your own phone. Attach the phone to the USB cable. If you uploaded the video to the cell phone from a computer you most likely already have this cable. The phone USB cord plugs into the power outlet of your phone, then plugs into an available USB port on the computer. Wait for the computer to detect the phone. Open "My Computer" (or "Computer" in Vista). Here you can see all the memory devices and drives attached to the computer. Open up your cell phone's folder (it is listed as a removable storage device). This displays all the content currently saved onto your phone. Look for the "Video" folder in the phone. It may be in the main display window, or it could be a sub folder. It depends on the particular phone you have. Click and drag the video from the folder in your phone onto the computer (either the desktop or a specific folder). The video now copies to the computer. I use my phone's cameras more than almost any other feature — and judging by how much of a priority has been placed on cameras lately, I'm not the only one. As the saying goes, the best camera is the one you have with you, and most people these days wouldn't dare leave home without their phone in their pocket. It's easier than you might think to shoot breathtaking video with your phone, and you likely don't need to buy any additional accessories to get started.Phones featured in this guideVideo powerhouse: LG V60 ThinQ (opens in new tab) (\$900 at Best Buy)CinemaWide: Sony Xperia 1 (opens in new tab) (\$1200 at Amazon)Check your settingsSource: Andrew Martonik / Android Central (Image credit: Source: Andrew Martonik / Android Central)No matter what phone you use, the first thing you should do before hitting the Record button is jump into your camera settings and make sure things are to your liking. Check that you're shooting in 4K (or 8K, if you're able and willing); even if you plan on exporting your final video in 1080p, the added resolution gives you plenty of wiggle room to crop in and reframe your shots in post without losing sharpness.You should also be on the lookout for options like HEVC and HDR10+. The former is a relatively new video codec that uses highly efficient compression algorithms to produce significantly smaller video files while retaining as much image quality as possible. HDR10+ (or any HDR standard, for that matter) expands your camera's dynamic range capabilities, allowing you to capture more detail in both the shadows and highlights of each shot, meaning you don't need to worry so much about over- or under-exposing your footage.Stabilization is yet another setting to check for. Most high-end phones offer a combination of optical and electronic image stabilization, which work together to produce smooth, almost gimbal-like footage, even when you're shooting handheld. Enabling EIS is a great way to remove any micro-jitters that might not be visible until you review your footage on a larger screen, but bear in mind that it can sometimes limit your recording resolution, since EIS operates by cropping and reframing your video footage.Not every phone offers manual camera controls, and even fewer carry that luxury over to video, but it's an incredibly powerful tool to have at your disposal. Phones that specialize in video, like the LG V60 and Sony Xperia 1, go beyond the normal point-and-shoot interface and give you access to settings like manual focus, white balance, exposure, and shutter speed.I'm generally a manual-everything kind of guy when I'm shooting with my dedicated mirrorless camera, but at the very least, you can make huge improvements to your phone's video output by taking advantage of manual focus and exposure. This will prevent your phone from pulsing in and out of focus as it searches for a subject, and ensures that moving from a bright environment to a dark one or vice-versa won't send your camera into a panic. In the V60's case, switching to manual focus automatically enables focus peaking, which highlights the areas in focus to make your life easier.These video-centric phones even allow you to go a step further and shoot in LOG, a flatter and more flexible image profile that allows for intense color grades in post. Both the V60 and the Xperia 1 also support LUTs, or lookup tables, allowing you to quickly apply different stylized looks to your footage, even as you're shooting. Your standard camera sensor in a phone still isn't large enough to stack up against the sensor in a dedicated camera, particularly in areas like depth and low light performance, but this is really where your phone can start to feel like a pocketable cinema camera.Use additional accessoriesSource: Hayato Huseman / Android Central (Image credit: Source: Hayato Huseman / Android Central)If your video needs go beyond the capabilities of your phone, it may be time to enlist some optional add-ons. Of course, if you're after stable video, the most obvious solution is to mount your phone onto a tripod or gimbal. The DJI Osmo Mobile 3 (opens in new tab) is a popular stabilizer that works with virtually any phone, and has some built-in tricks like Dolly Zoom and Hyperlapse that do far more than just remove hand jitters. There's also a bevy of tripods that feature phone clamps; I've been fairly happy with the Joby Handypod Mobile (opens in new tab), which doubles as a grip to go handheld with your phone.Additionally, if your phone is lacking in a particular optical range, you might also want to expand the versatility of your camera(s) by adding interchangeable lenses. I love pairing the Pixel 4 with Moment's 18mm Wide Lens (opens in new tab), which allows me to achieve the ultra-wide look I wish Google would've included in the first place, while maintaining the pristine image quality of the Pixel's primary sensor.Additional EquipmentDJI Osmo Mobile 3 (opens in new tab) (\$119 at Amazon)The Osmo Mobile 3 is a compact gimbal that lets you shoot cinematic, smooth video with virtually any phone. It folds up for portability, recharges over USB-C, and offers various preset actions like Slow Motion and Timelapse.Moment Wide 18mm Lens (Image credit: Moment)Moment 18mm Wide Lens (opens in new tab) (\$100 at Amazon)Moment's 18mm lens attaches to any supported phone with a Moment case, and features aspheric glass that ensures pristine image quality. You can combine it with your phone's existing lenses to achieve unique perspectives.
